MULTIPLYING BINOMIALS PRACTICE PROBLEMS

1. Match each quadratic expression with an equivalent expression in factored form.
Show your work.

E 1. $x^2 + 6x = x(x+6)$	A. $(x+7)(x-1) = (x)(x) + (x)(-1) + (x)(7) + (7)(-1) = x^2 + 6x - 7$
B 2. $x^2 + 6x + 5$	B. $(x+5)(x+1) = (x)(x) + (x)(1) + (5)(x) + (5)(1) = x^2 + 6x + 5$
A 3. $x^2 + 6x - 7$	C. $(x+4)(x+2) = (x)(x) + (4)(x) + (x)(2) + (4)(2) = x^2 + 6x + 8$
C 4. $x^2 + 6x + 8$	D. $(x+3)(x+3) = (x)(x) + (x)(3) + (x)(3) + (3)(3) = x^2 + 3x + 3x + 9 = x^2 + 6x + 9$
D 5. $x^2 + 6x + 9$	E. $x(x+6) = x^2 + 6x = x^2 + 6x + 9$

2. An equation of a circle is $x^2 - 8x + 16 + y^2 + 10y + 25 = 81$.

- a. What is the radius of the circle?

The radius of the circle is 9.

$$x^2 - 8x + 16 + y^2 + 10y + 25 = 81$$

$$[x^2 + 2(4)x + 4^2] + [y^2 + 2(5)y + 5^2] = 81$$

$$(x-4)^2 + (y+5)^2 = 81$$

$$(x-4)^2 + (y+5)^2 = 9^2$$

- b. What is the center of the circle?

The center of the circle is (4, -5).

3. Write 3 perfect square trinomials. Then rewrite them as squared binomials.

$$x^2 + 10x + 25$$

$$(x+5)^2$$

$$x^2 - 8x + 16$$

$$(x-4)^2$$

$$x^2 - 6x + 9$$

$$(x-3)^2$$

4. a. Write an equation of the circle that has a diameter with endpoints $(12, 3)$ and $(-18, 3)$.

$$(x + 3)^2 + (y - 3)^2 = 15^2$$

1a. Graph the circle $(x - 2)^2 + (y - 1)^2 = 25$.

1b. For each point, determine if it is on the circle. If not, decide whether it is inside the circle or outside of the circle.

i. $(4, 0)$ ← not on circle
 distance from (x, y) to center $(2, 1)$ must be 5.

$$\sqrt{(4-2)^2 + (0-1)^2} = \sqrt{4+1} = \sqrt{5} < 5 \text{ inside circle}$$

ii. $(-3, 3)$ ← not on circle

$$\sqrt{(-3-2)^2 + (3-1)^2} = \sqrt{25+4} = \sqrt{29} > 5 \text{ outside circle}$$

iii. $(-2, -2)$

$$\sqrt{(-2-2)^2 + (-2-1)^2} = \sqrt{16+9} = \sqrt{25} = 5 \text{ on the circle}$$

d. How can you use distance calculations to decide if a point is inside, on, or outside a circle?

If the distance from the center of the circle to the point is:
 equal to the radius (on the circle)
 less than the radius (inside the circle)
 greater than the radius (outside the circle)

5. The triangle whose vertices are $(2, 5)$, $(3, 1)$, and $(4, 2)$ is transformed by the rule $(x, y) \rightarrow (x - 2, y + 4)$. Is the image similar or congruent to the original figure?

a. The image is congruent to the original triangle.

The transformation $(x, y) \rightarrow (x - 2, y + 4)$ is a translation, therefore there exists a sequence of rigid transformations that takes the image to the pre-image. (\Rightarrow they are \cong)

$(x, y) \rightarrow (x - 2, y + 4)$
 moves image left 2 units
 moves image up 4 units

b. The image is similar but not congruent to the original triangle.

c. The image is neither similar nor congruent to the original triangle.
